Hi Man – I'm at my desk and you can call. I'm interested in two things:

- A. Within LAR watershed....does Basin Plan define where freshwater vs. saltwater WQS apply?
- B. Does anyone know/estimate how far the saltwater goes up into LAR during typical tidal action?
- C. In the case of industrial facilities (under IGP), Stormwater samples are typically collected as grabs, right? Thus one might prudently compare the results to acute WQS and not to chronic WQS, unless you have a 24 hr or longer composite sample.

Feel free to call and leave vmail message if you prefer.
